Visual Evidence

One observed moment

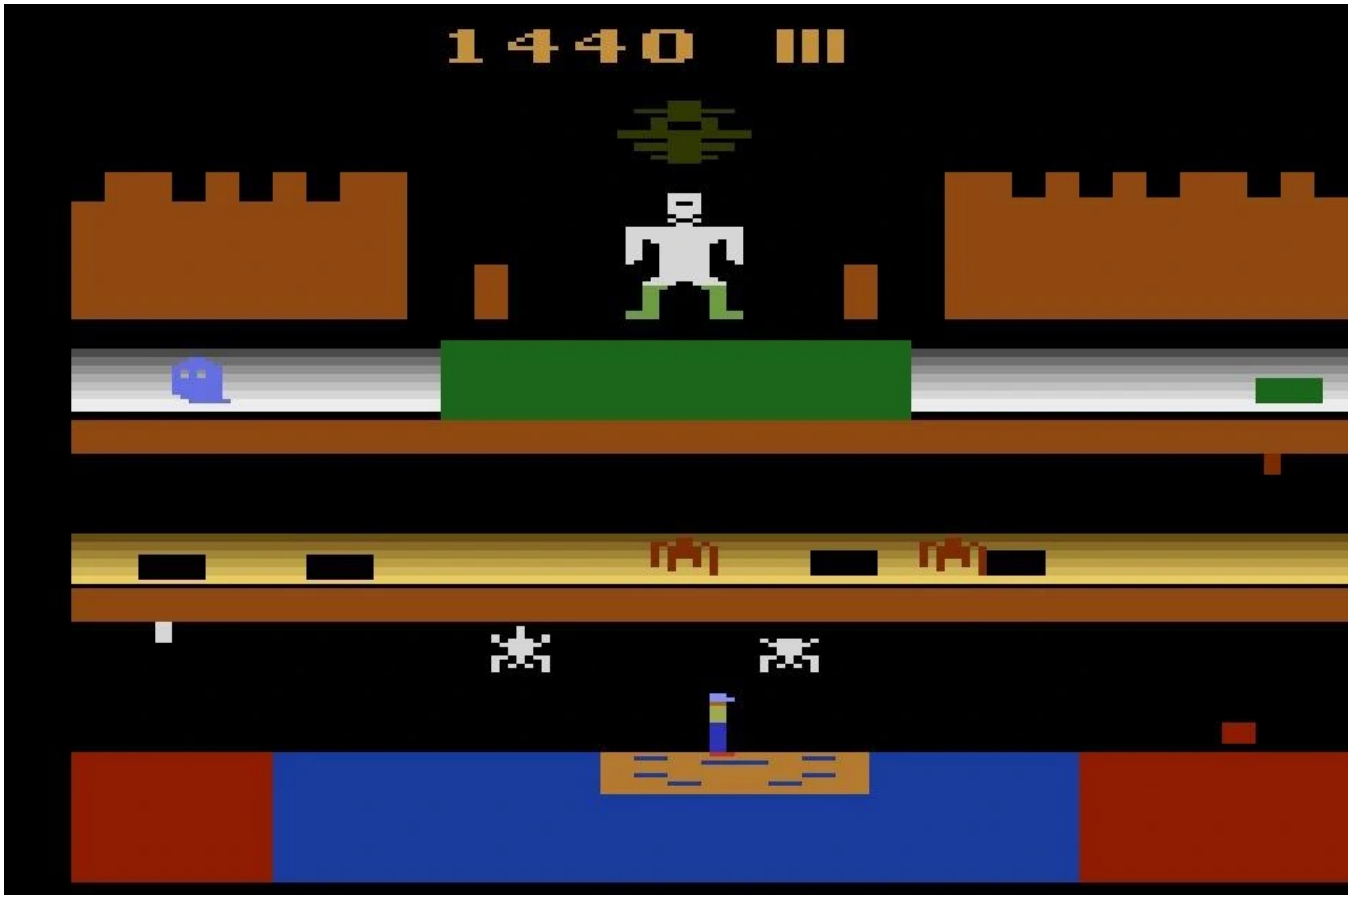

Image evidence prompt

Submit one original screenshot or still of your Case Study 1 Atari game. Caption it with the title, version or platform when known, the scene shown, and its source. A relevant image from your first case study may be reused.

Requirements and potential deductions

- The image shows the original scene used for this redesign. (up to -0.5 points)
- The caption identifies the selected Atari game, scene, and image source. (up to -0.5 points)

Caption: Frankenstein's Monster (Atari 2600, 1983), original gameplay showing the player moving across platforms beneath the monster. Source: Retro Arcadia.

Visual Redesign

Improvement goal

Response prompt

Identify one visual problem in the original scene and explain the mood or player experience your redesign should support. Refer to a specific detail in the original image.

Requirements and potential deductions

- Identifies a visual problem using a specific detail from the original scene. (up to -0.75 points)
- Explains the intended mood or player experience of the redesign. (up to -0.75 points)

Submitted response

In the original scene, one problem I had was not knowing when certain enemies, especially spiders, would appear. This made
annoying because sometimes I couldn't react fast enough or juke out of the way. I want to keep the horror feeling of the game
make the player and hazards easier to see so it's easier to react to danger.

Revised palette

Response prompt

List your proposed colors and their roles, including any neutrals. Explain why this palette size and a named color relationship suit your improvement goal, and how contrast makes an important element stand out. Color names or swatches are sufficient; exact color codes are optional.

Requirements and potential deductions

- Identifies the proposed colors and what each is used for. (up to -0.5 points)
- Justifies the palette size and a named color relationship using the improvement goal. (up to -0.75 points)
- Explains a contrast choice that makes an important element stand out. (up to -0.75 points)

Submitted response

I would use a small palette with six main colors:
Black: Background to keep the horror atmosphere.
Gray: Castle walls and platforms.
Keep the same color (blue/green/brown): Player character so they stand out.
Red: Enemies and hazards like spiders and bats.
Green/Red: Frankenstein's Monster. I would also have him become red to show you're doing affect on him.
Yellow: Bricks, score, and other important information.
I would also add more detailed looking ladders.

I chose these colors because Black and gray keep the background darker, while white makes the player stand out. Red and gr
are complementary colors, which helps create a difference between enemies and Frankenstein's Monster. I would keep the br
and Gray for the bricks and important information so they are easier to notice.

Redesigned scene

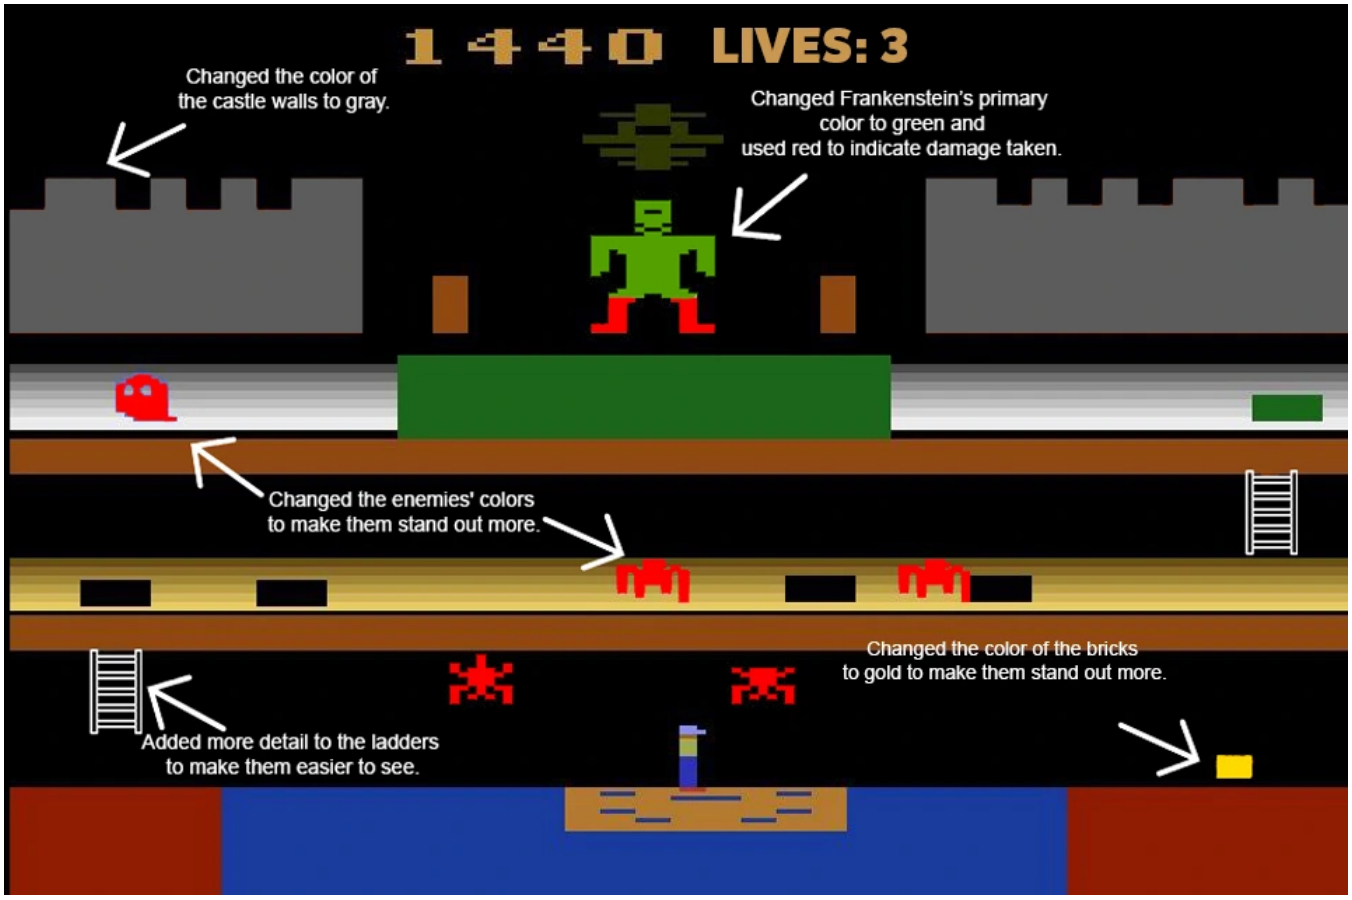

Image evidence prompt

Submit a colored sketch, annotated recoloring, or mockup of the same scene using your proposed palette. Include a gameplay element and an interface or state indicator. Keep an important state understandable without color alone, using a label, shape, or icon. Caption the image to identify the scene and your changes.

Requirements and potential deductions

- The redesign applies the proposed palette to the same scene's gameplay element and interface or state indicator. (up to -1.25 points)
- An important state has an understandable label, shape, or icon in addition to its color. (up to -1.25 points)

Caption: I changed the castle walls to gray, made the enemies stand out more, changed Frankenstein's primary color to green, and used red to indicate damage taken. I also added more detail to the ladders, changed the bricks to gold, and made the lives counter clearer by adding the label “LIVES”

Look and feel decision

Response prompt

Explain one visual change beyond the palette, such as composition, interface layout, character shape, or an animation you would add. Connect it to a relevant Chapter 6 concept from vision, interface, ambience, or storytelling and explain its intended effect on the player. Describe motion in words if your sketch cannot show it.

Requirements and potential deductions

- Connects a specific visual change beyond the palette to a relevant Chapter 6 concept. (up to -0.75 points)
- Explains how that change would affect the player's experience. (up to -0.75 points)

Submitted response

I think besides changing the colors, I would make it easier to time when certain enemies come out, and also I would fix the prob with the speed and timing of things like jumping. This connects to the concepts from Chapter 6 from vision because objects sho easy to distinguish from the background. I think timing and visual cues are very important for a game like this so I would focus that.

Evaluate the redesign

Response prompt

Compare your redesign with the original scene. Explain how the revised visuals work together to address your improvement goal while keeping the game's core actions and rules. Refer to a specific difference visible in the two images.

Requirements and potential deductions

- Evaluates the combined effect of the revised visuals on the improvement goal using a specific

before-and-after difference. (up to -0.75 points)
- Explains how the original core actions and rules remain intact. (up to -0.75 points)

Submitted response

My redesign makes the different objects easier to see. For example, I changed the castle walls to gray, the bricks to gold, and t
enemies to red so they stand out more against the black background. This is especially important for the enemies like the spide
because they were sometimes hard to notice when they would come out, making it difficult to react. I also made the lives count
clearer by adding "LIVES". These changes improve the visuals because being able to read the numbers is a helpful visual aid.
core gameplay stays the same but I would tweak the speed and jumping mechanics a little.
